There has been little research on the use of antidepressants in bipolar disorder, but most experts consider the following 3 types to be first choices: As mentioned earlier, research has shown that these atypical antipsychotics have mood stabilizing properties. Other anticonvulsants used as mood stabilizers Carbamazepine Tegretol, Carbatrol. Electroconvulsive therapy ECT, discussed later, is also considered a mood stabilizing treatment. If used without a mood stabilizer, an antidepressant can cause a person with bipolar disorder to go into a manic state. Divalproex is equally effective in both euphoric and mixed manic episodes. Unlike many of the other mood stabilizers, topiramate does not appear to cause weight gain and may actually help people lose weight. Common side effects of the atypical antipsychotics include drowsiness and weight gain. One strength of gabapentin is that it is unlikely to interact with other medications, so that it can be easily added to other mood stabilizers to augment their effect. Monitoring blood levels of lithium can reduce side effects and ensure that the patient is receiving an adequate dose to help produce the best response. Recent research suggests that it can act as a mood stabilizer, and may be especially useful for the depressed phase of bipolar disorder. Skip to main content. If these do not work, or if they cause unpleasant side effects, the other choices are: Although it is very effective, clozapine is not a first choice medication because it can cause a rare and serious blood side effect, requiring weekly or biweekly blood tests. Lithium appears to be less effective in mixed manic episodes and in rapid-cycling bipolar disorder. One serious problem with the older antipsychotics is the risk of a permanent movement disorder called tardive dyskinesia TD. Your doctor may also prescribe other medications to help with insomnia, anxiety, restlessness or other occurring symptoms. Blood level monitoring and dose adjustments may help minimize side effects. Approval And Uses of Lamotrigine. In the United States, this drug received marketing approval way back in December and it was only in that it received FDA approval because of the benefits derived from it when used on bipolar patients. Initially, Lamotrigine was approved as an anticonvulsant. Building on anecdotal reports of lamotrigine's psychotropic properties in epileptic and bipolar patients, Calabrese et al () conducted the first study to investigate its spectrum of therapeutic activity in bipolar disorder.
