Phentermine is a mainstay of weight-loss clinics nationwide, prescribed by physicians who profit by selling the pill to patients. Adding to the concern is the fact that many doctors have an incentive to recommend it: Views Read Edit View history. Phentermine has some similarity in its pharmacodynamics with its parent compound, amphetamine, as they both are TAAR1 agonists, [6] where the activation of TAAR1 in monoamine neurons facilitates the efflux or, release into the synapse, of these neurochemicals; at clinically relevant doses, phentermine primarily acts as a releasing agent of norepinephrine in neurons, although, to a lesser extent, it releases dopamine and serotonin into synapses as well. Phentermine is used for a short period of time to promote weight loss, if exercise and calorie reduction are not sufficient, and in addition to exercise and calorie reduction. Still, patients who take phentermine must be screened, because the drug can intensify existing heart problems and it can be abused by people with eating disorders. Strebig said that in some patients, phentermine can cause chest pains, pressure in the lungs and shortness of breath. Copyright Los Angeles Times.
